Security for your keys

Protect your keys as they control access to critical areas and high-value objects. When the keys are better managed, your assets will be safer than before.

Permission settings

People without permission cannot access the key. Each key is only the responsibility of the authorized user. This means less key loss and accidental loss of property.

Real-time

The system automatically records the use of the key in real time, providing access records and reports. By checking access history, you can always get the latest information.

Remote management

You can easily configure the keys with system software and remotely set permission for users. Online control and inquiries help reduce costs and increase efficiency.

24 Hours

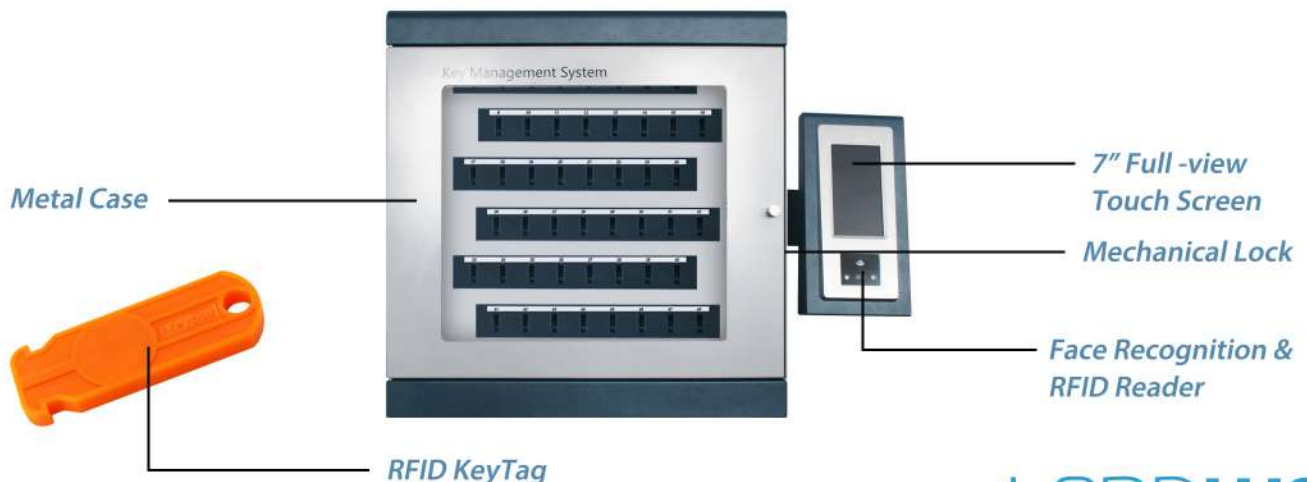

Authorized users can retrieve and take the keys at any time, which means less labor costs and lower dependencies. By checking the access history, you can easily complete key management.

System compatible

The System is compatible and can be integrated into the company's access control, monitoring, attendance, ERP and other systems to achieve system networking.

Modular design

The Landwell Key Management System can be standard or tailored to suit the needs of different customers. The key module and the storage module can be combined in one system.
